A. Readable error

the planted claim can be checked against a value already on the page

```
1: c = 43
2: s = 5
3: a = c + 44
4: p = s + 15
5: u = c + s          → u = 48
```

`note: u = 84` <- contradicts u = 48

model's real continuation

```
6:  n = u;          n = 48
7:  w = c + 39;     w = 82
8:  j = n + 16;     j = 64
9:  m = 23;         m = 23
10: d = n + 15;     d = 63
11: out = j + d;    out = 127
12: print(out);     output = 127
```

`output = 127` correct (used u=48, ignored note)

B. Computed error

the planted claim can only be caught by re-doing the arithmetic

```
1: x = 36
2: u = 6
4: k = x + 34       → k = 70
5: c = u + 31       → c = 37
6: j = k + c
```

`line 6: j = k + c; j = 97` <- should be 107

model's real continuation

```
7:  p = 38;         p = 38
8:  n = j + 11;     n = 108
9:  t = 15;         t = 15
10: r = j + 16;     r = 113
11: out = n + r;    out = 221
12: print(out);     output = 221
```

`output = 221` wrong (truth 241, absorbed j=97)
