

Showing the wrong arithmetic does not stop absorption

what the model is shown at $k=1$ (true value 90, planted 100):

bare line 10: $n = y + z; n = 100$

full line 10: $n = y + z = 32 + 58; n = 100$

partial line 10: $n = y + z = \dots + 58; n = 100$

'full' spells out $32 + 58 = 90$ — yet the wrong 100 is still copied.
